

# CBPM 12W triplet gain study

Antoine

CBPM meeting: March 24, 2023

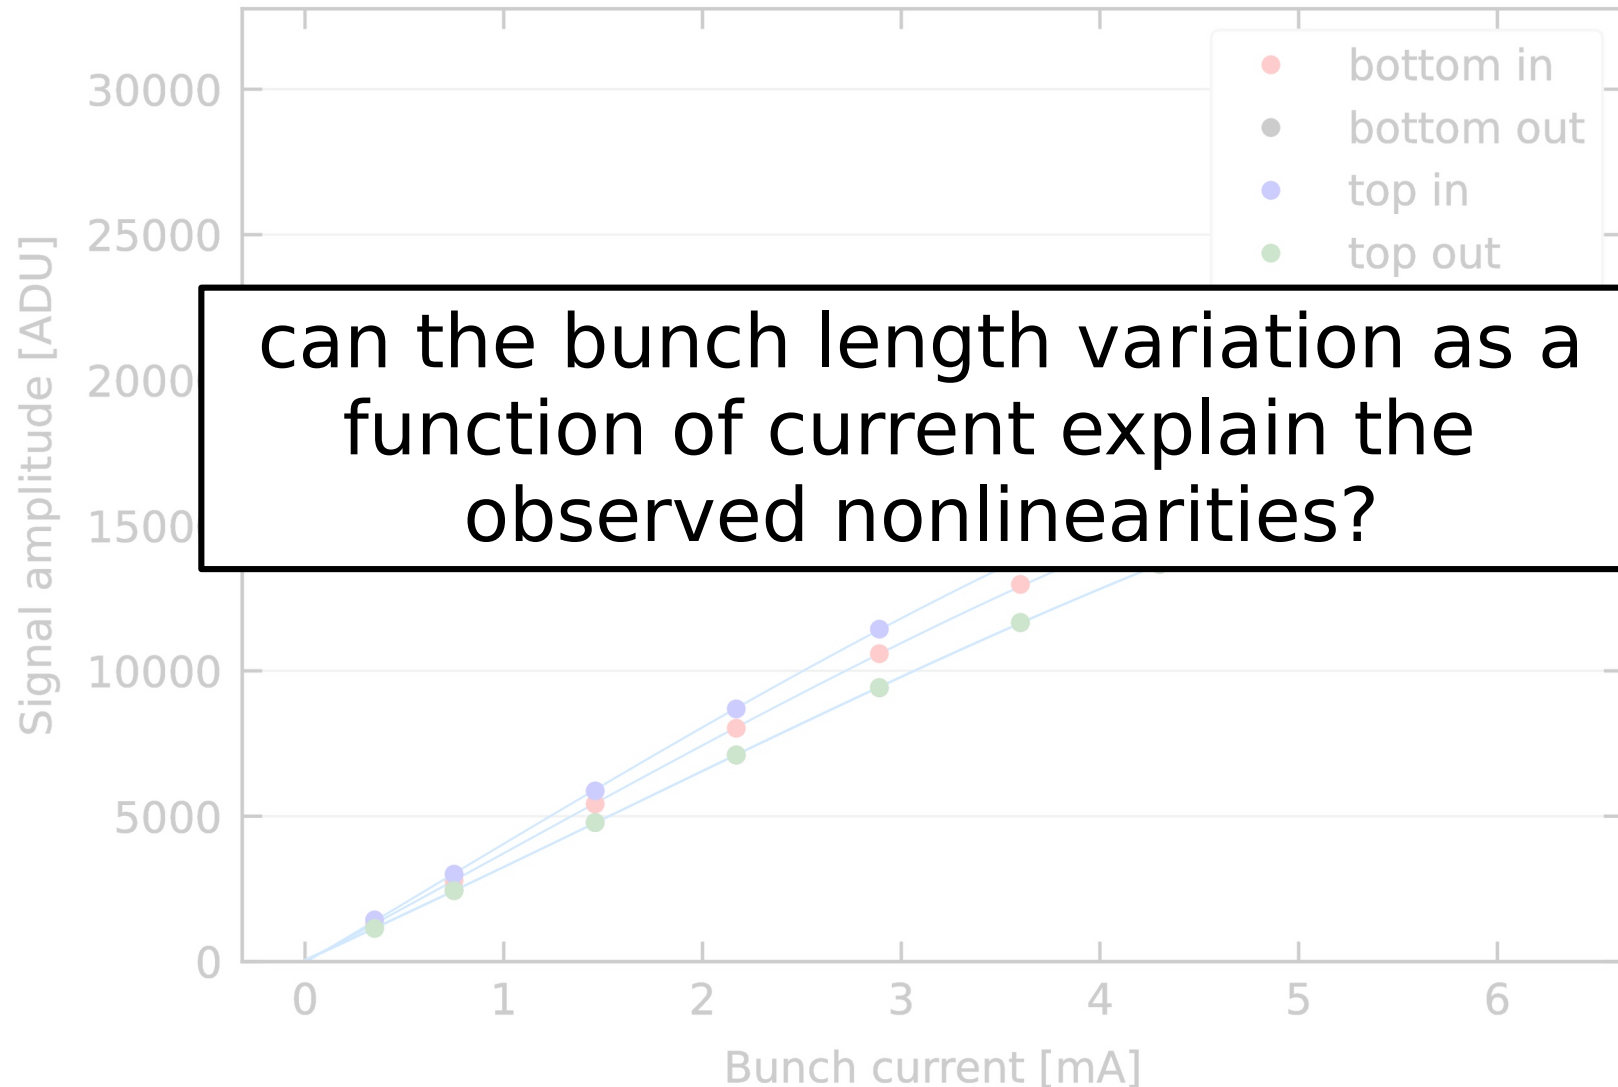

# PREVIOUSLY: signal amplitude vs bunch current

**12W cubic** fit to data (w/o uncertainty)

# PREVIOUSLY: signal amplitude vs bunch current

12W cubic fit to data (w/o uncertainty)

# Bunch length and nonlinearities

## Study:

- 1) let's use Suntao's bunch length vs current information
- 2) produce bunch profiles at various bunch currents
- 3) take the derivative of bunch profiles → button waveform/amplitude

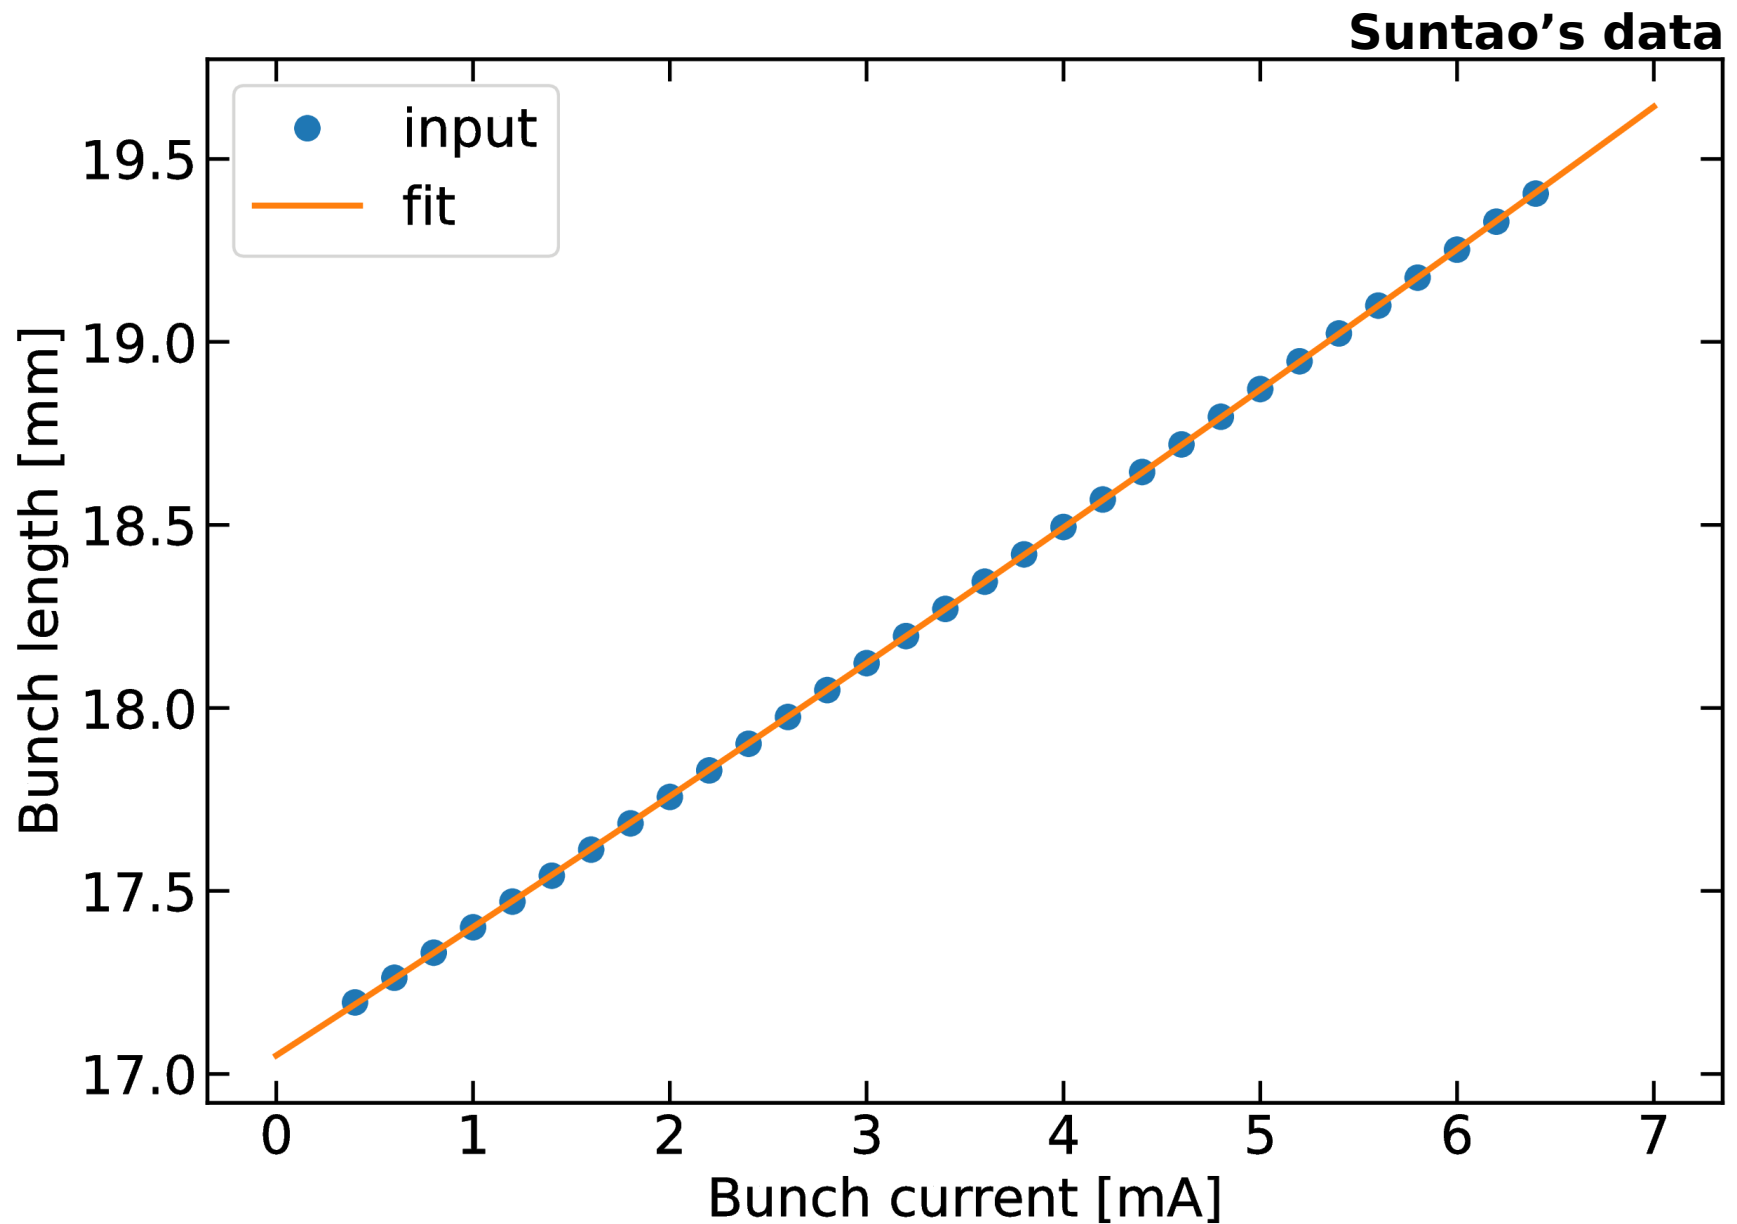

Given proper reference scaling, we can compare measured and predicted amplitude as a function of bunch current

## What's missing:

- x electronics effects (low-pass filters)
- x wakefield and relativistic E&M

# Bunch length versus current

Restricted to current values we care about today

# Bunch profile and button response

Gaussian beam profile and its derivative (button response)

# All bunch profiles

Profile's integral normalized to bunch current

# All waveforms

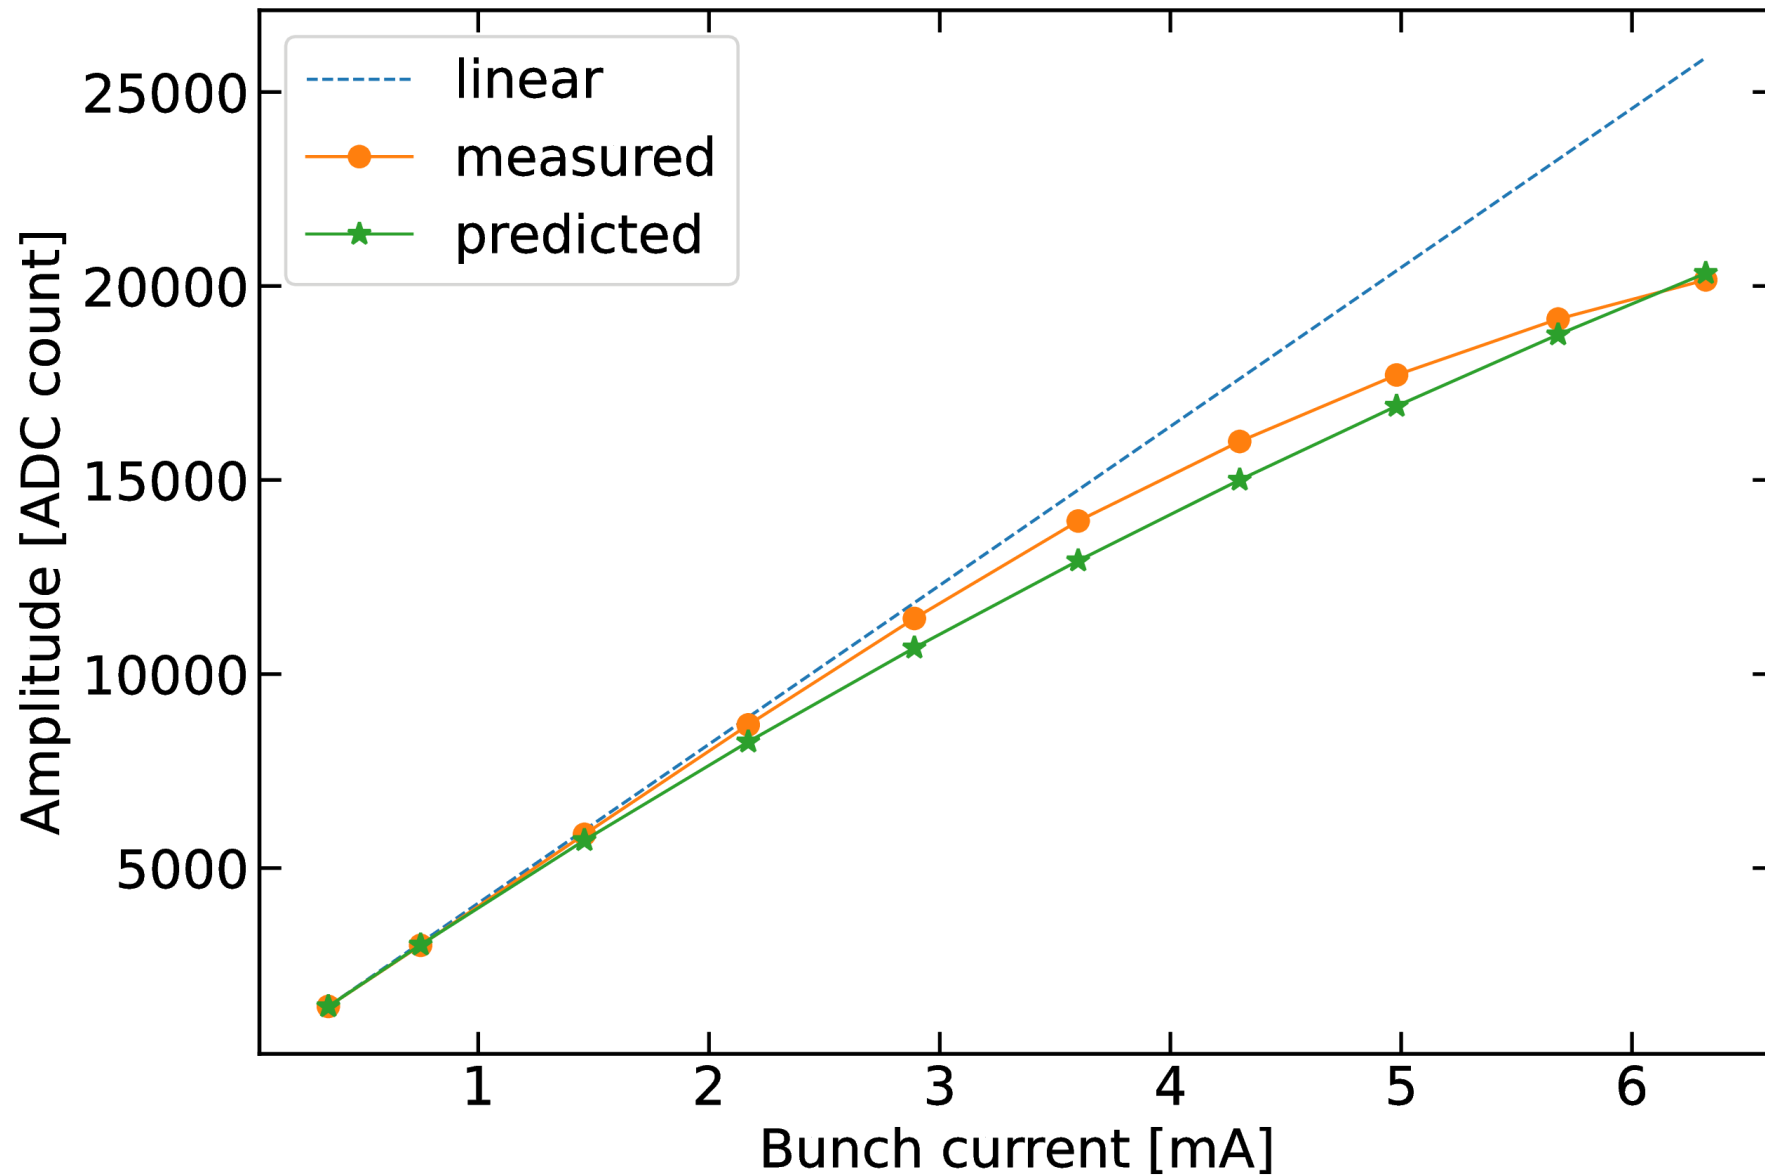

Waveform amplitude reference = measured amplitude at 0.35 mA

# Measured vs predicted

Prediction amplitude reference = measured amplitude at 0.35 mA

# Not good enough?

That's weird that we get more nonlinearities than measured...

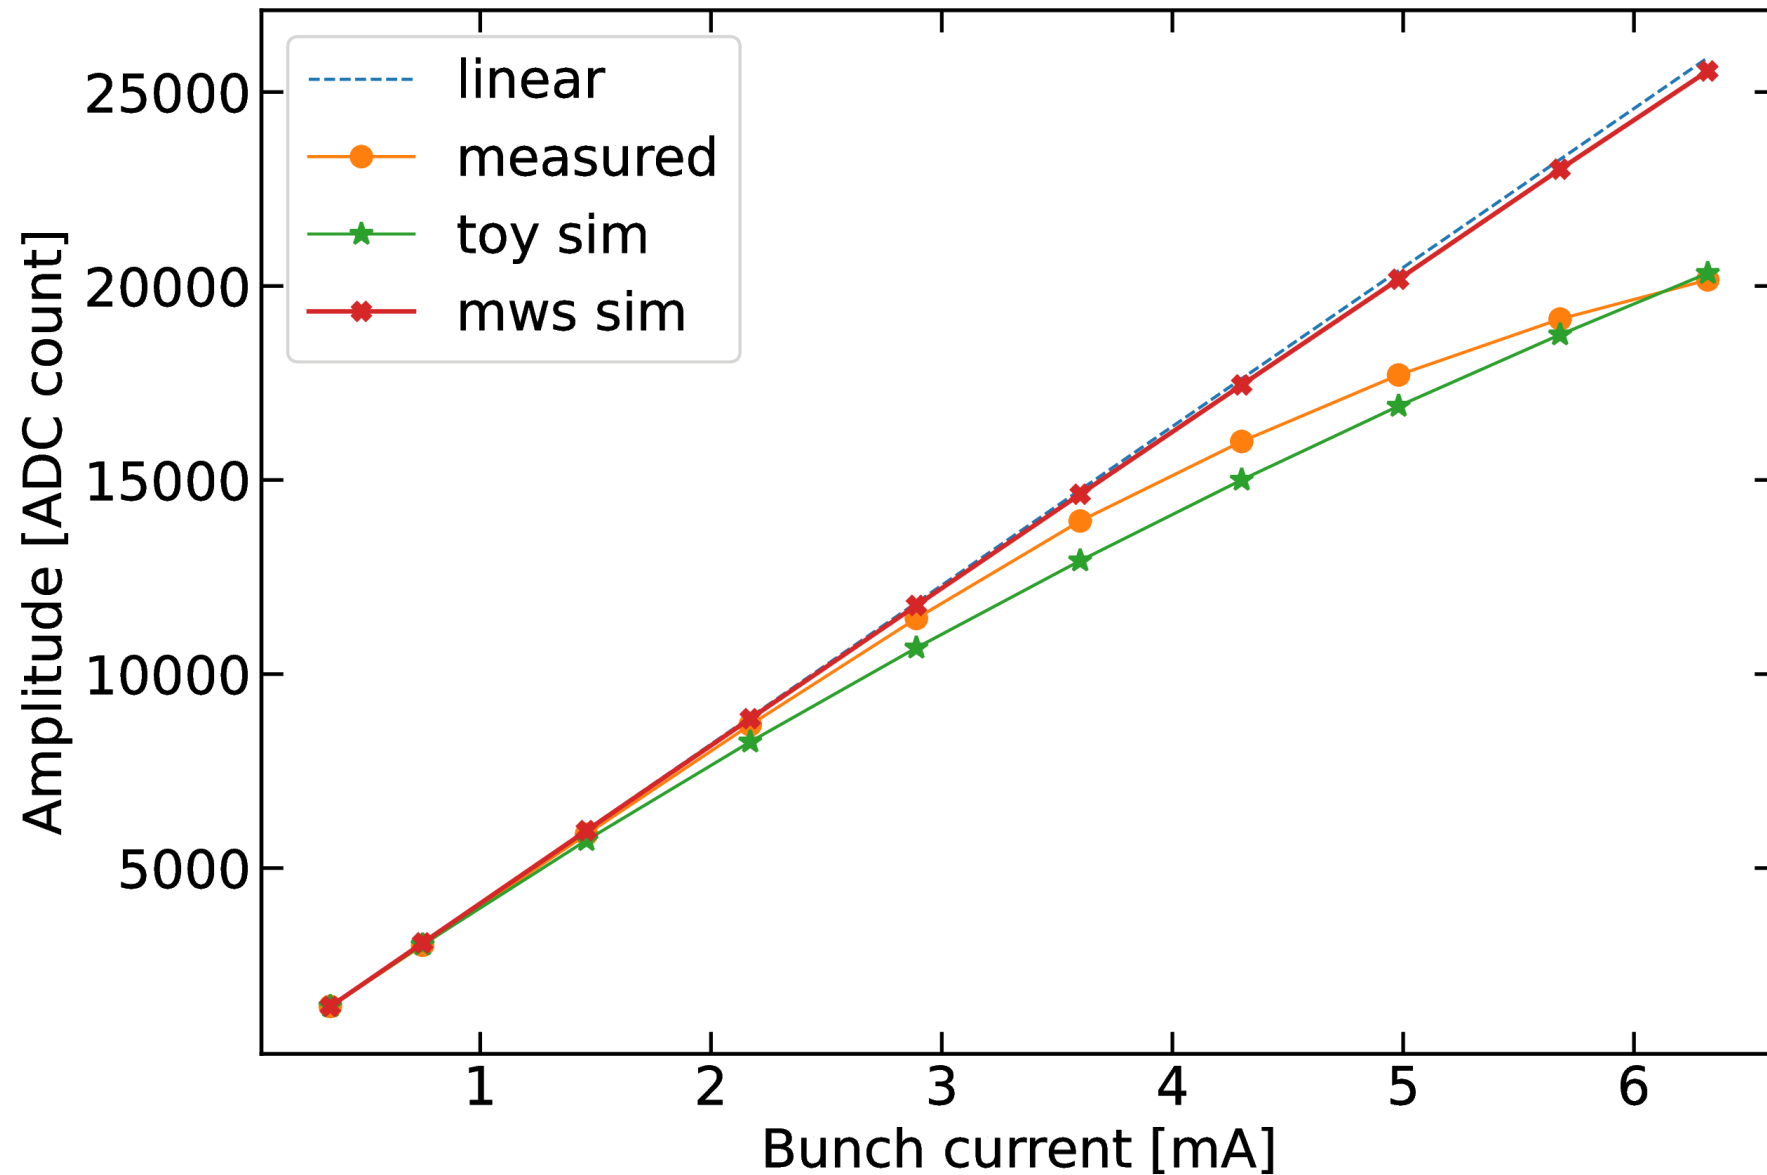

We probably want a more accurate study that includes:

- × relativistic E&M wakefield
- × 1.2 GHz and 0.6 GHz low-pass filter

Simulation done using CST Microwave studio

# Measured vs predicted

Simulation amplitude reference = measured amplitude at 0.35 mA

# So...?

Almost no nonlinearities expected from the increasing bunch length...

Let's look at the data collected Tuesday March 21 (FIXED GAIN only):

x [instr elog 2088, 2087](#)

x 2 AFEs of module sitting at 12W (ctacf133) were modified by Len for more signal amplification following Bob's design (see details [here](#)): x2.5 amplitude measured on the bench

from Bob

Object is to test fixed gain and variable gain with full signal amplitude.

1. Remove: R67 49.9 ohm (extra termination)  
Replace: DNP
2. Remove: R63, R66, R68 16.9 ohm (6dB attenuator)  
Replace: 0 ohm jumper
3. Remove: R58, R84 49.9 ohm (excess termination)  
Replace: 100 ohm
4. Remove: R72, R96 49.9 ohm (extra termination)  
Replace: DNP
5. Remove R71, R75, R94, R98 33 ohm (excess termination)  
Replace: 100 ohm
