

Gain calibration

Antoine

CBPM meeting: October 27, 2023

instr elog 2152

Message ID: 2152 Entry time: 2023-10-02, 12:10, Monday	
Author:	Antoine T Chapelain, Jim Shanks
Subject:	CBPM gain calibration
Category:	Operation
Instrument:	CESR BPM
Sub-System:	CBPM_II
Shift Key:	20231002_1200
Shift goal	
Calibrate the CBPM gains from the following list: 32W , 33W , 34W, 42W, 43W, 44W, 42E, 43E, 44E, 25E , X5G, 26W and 47E . Also: collect turn-by-turn data for highest shaker amplitudes to compare Rubin's method and the new calibration gain one.	
How?	
For a given CBPM: collect turn-by-turn data for 9 beam positions on a +/- ~2 mm grid. Then run the offline analysis to extract t	
Let's a-go	
Bad new: 32W and 33W are still not responsive after the modules being swapped and Mike trying all the known tricks. More in 47E, 25E are not returning data.	
Let's start with the following bunch (beam at these positions moved at the same time):	
26W 42E 42W	

Gains were calibrate during the shift: let's double check the results
